Hi Michael,

This can be done with writing plugin code, if you're up to it. The plugin has two extension points - the one you'll want to use is JiraOperationExtension. All of the operations implement this, and you can add your own.

See AddComment.java for an example:

https://github.com/jenkinsci/jira-ext-plugin/blob/master/src/main/java/org/jenkinsci/plugins/jiraext/view/AddComment.java

If you're up to this I answer questions along the way, and help me better document it.

If you're not up to this, please open a feature ticket in jira:

https://issues.jenkins-ci.org/

In such cases it would be great, if there was a way to prevent the plugin to trigger the transition again, if the Before status and After status are the same.
